The authors have studied the reactogenic and immunologic properties of live and killed typhus vaccine. The results of the study show that the live vaccine is more effective than the killed vaccine. The live vaccine induces a stronger and more durable immune response. The killed vaccine induces a weaker and less durable immune response. The live vaccine is recommended for use in the prevention of typhus.

Fused magnesite as a refractory material. Ya. V. Klyucharev. *Geotekhnika* 2, No. 4, 4-10(1964); *Ann. ZIN*, 1965, 1, 708-9. The possibility of using fused magnesite instead of ordinary magnesite as a raw material for magnesite brick for refractory was investigated. A series of tests comparing fused magnesite and quartz in varying amounts was tested. Water glass, Soviet cement or oil-ground fused magnesite served as binding agents. Bricks were pressed at 400-700 kg/cm², dried in air and then burned at about 1600°. The bricks made without water glass and with only oil-ground magnesite were superior, especially in refractoriness. Practical tests showed them to have about 3 times the durability of bricks made from ordinary magnesite. The different products of varying m. po. formed in the refractory during the fusion of the magnesite are of equal value for the material of brick. M. G. Mendel

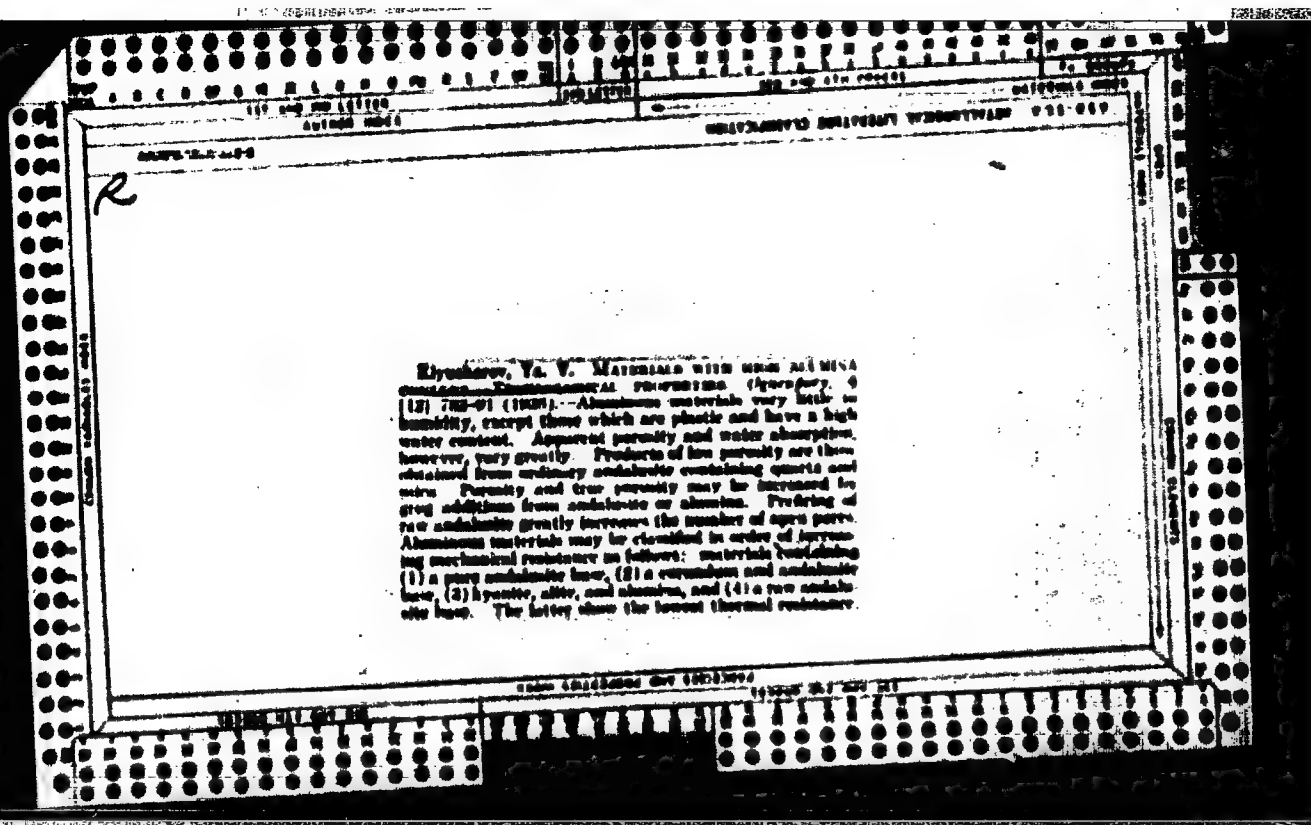

410-51-0 DETAILING LITERATURE CLASSIFICATION

KLYUCHAROV, Ya. V.

Klyucharov, Ya. V. Siemensite. *Ogneupov. 3 (8)*
 1951-1952 (1953). Investigation of four samples of cast and
 pressed Siemensite disclosed a higher content of metallic
 iron in the latter; the mineralogical composition was the
 same for both (spinel 83.6, opaque mineral 11.1, glass 2.3,
 pores 3.0%); the specific weight differed (1.98 for cast
 Siemensite, 2.70 for the pressed sample); the porosity of
 the former was much lower (1.17 against 15.65 to 15.73);
 the temperature of the beginning of shrinkage under load
 of pressed Siemensite (1840°) was lower than data found in
 the literature concerning the cast variety (1900°). The
 resistance to swelling was not high (11 swellings).

KLYUCHAREV, Ya. V.

Klyucharev, Ya. V., and Lysenko, S. A. *Usp. Khim.*
1964, 33, 1 (1964). -- To obtain products of sufficient
density and mechanical strength, well-fired magnesite
containing not less than 94% MgO and not more than 2%
CaO should be used. To lower shrinkage and raise the
resistance to pressure under load at high temperature,
about 25% chromite must be added. For greater density
and durability, as well as lower shrinkage, grains of magne-
site not coarser than 1 mm and of chromite, 2 to 3 mm,
should be used. Two types of bonding material are neces-
sary: (1) an organic and (2) a ceramic bond containing
10% clay and 5% natural borate.

REFRACTORY DUNITE MASS. Ya. V. Klyucharev and A. G. Morozov. *Trudy Vsesoyuz. Nauch. Otdelov* 1939, No. 12, 22-23; *Chem. Zvezd*, 1940, 1, 2268. — Expts. are reported on the mass. of dunite from Ural dunite for use as lining material for Martin furnaces. The dunite used as raw material contained SiO_2 28.08, TiO_2 0.14, Al_2O_3 0.21, FeO 3.46, P_2O_5 0.12, MgO 44.12, CaO 0.03, K_2O 0.20, Na_2O 0.20, Cr_2O_3 0.24, MnO 0.12 and lost 1.00%. Microscopically it consisted of 20% olivine and 80% serpentine. The use of the following mixts. gave good refractories with high resistance to the attacks of both acid and basic slags: (1) dunite 80, magnesia 10 and clay 1%; (2) dunite 64, magnesia 18 and clay 1%; (3) dunite 76 and magnesia 24%. To obtain lower porosity and greater mech. strength than that obtained from the above mixts., the following is recommended: dunite 64, magnesia 12, chromite 20 and clay 1%. M. G. Morozov

KLYUCHAREV, Ya. V.

Kyanite flotation concentrate as a ceramic raw material.
 Ya. V. KLYUCHAREV, *Keram. Stroya*, No. 17, pp. 45-50 (1947).—A review of the literature is followed by some experimental data obtained by K. with kyanite flotation concentrate. Quality concentrate should contain not less than 84% alumina and not over 0% alkali; refractoriness should be not lower than 1810° to 1820° and specific gravity not less than 3.48. The last two figures can be used to evaluate the concentrate without resorting to chemical analysis except to determine loss on ignition. Ignition loss serves as an index of the mica content and should not exceed 1%. The concentrate should be dehydrated as much as possible for the preparation of semi-dry batches. 37 references. *Ci. TITLE: Thermal Expansion of Lining Materials in the Sintering Zone of Rotary Cement Kilns (Teplovoye rasshireniye futerovochnykh materialov zon spekaniya tsementnykh vrashchayushchikhsya pechey)

PERIODICAL: Tr. Gos. Vses. in-t po proyektir. i nauchno-issled. rabotam v tsementn. prom-sti, 1958, Nr 20, pp 31-45

ABSTRACT: Experimental work was carried out on the determination of thermal expansion (E) of chrome-magnesite brick (CB) KhM-4 and of mortars of various composition. Two types of blocks for model brickwork were used, namely, blocks 20x20x23 and 20x20 x 24-mm size, sawed out of CB and joined with 3-mm mortar seams. Fresh mortar was prepared from magnesite, chrome-magnesite, and caustic magnesite which were mixed with sintering additives (metal filings or pyrite cinders); the grain-size composition of the mixture was variable. Experiments were also conducted in replacing mortar with metal plates (2 mm). Mortar burned at 1450°C and unburned mortars were tested. The following conclusions were drawn on the

Card 1/2

SOV/137-59-1-58

Thermal Expansion of Lining Materials in the Sintering Zone of Rotary Cement Kilns

basis of the experiments: Thermal E of magnesite and chrome-magnesite mortars with filing added exceeds the E of CB, whereas E of mortar with addition of pyrite cinders at $>1250^{\circ}$ is lower than of brick, which partially compensates the free E of the brick. When metal plates are used the thermal E of the brickwork is only slightly different from the E of CB. Changes in the linear dimensions of magnesite and chrome-magnesite mortars after service in rotary kiln are related to the change in the phase composition of the seam. In the cold zones of the lining heated to $500 - 600^{\circ}\text{C}$ the mortar changes but little in volume; above $500 - 600^{\circ}$ thermal E sharply increases (attaining 5%), more especially with elevated Fe oxide content in the mortar; in the hot areas the E of the mortar attains 1.6 - 2.2%; at $>1200 - 1300^{\circ}$ temperatures the mortar begins to contract, compensating for the expansion of the CB. Thermal E of the Podolskiy-plant mortar made of caustic magnesite with additions of pyrite cinders is 60% less than the E of chrome-magnesite mortars.

TITLE: The Effect of the Conditions of Magnesia-Clay Spinel Synthesis on
the Technical Properties of Products

PERIODICAL: Tr. Leningr. tekhnol. in-ta im. Lenzoveta, 1959, No. 57, pp. 50-64

TEXT: The authors studied the effect of mineralizing additives such as CaF_2 and TiO_2 on the synthesis process and the properties of spinel refractories. Dispersion parameters (limit size of grains 60μ , fractions below 1μ , 25-30%) are determined making the addition of 3% TiO_2 and CaF_2 sufficient to reduce the synthesis temperature to $1,450^\circ\text{C}$. It is established that TiO_2 forms Mg titanates which partially pass into solid solutions with the spinel; at about 950°C , CaO is formed from CaF_2 and bound with Al_2O_3 into aluminates. CaF_2 causes a less compact structure but a better heat resistance of the product than titanium dioxide. The method of introducing mineralizers affects the technical properties of the products: their structure is improved, mechanical strength and heat

TITLE: Formation and technical properties of solid solutions in the $MgO-Al_2O_3-Cr_2O_3$ system

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 8, 1965, 1403-1409

TOPIC TAGS: magnesium oxide, aluminum oxide, chromium oxide, refractory compound, solid mechanical property, solid solution

ABSTRACT: The process of binding of ¹magnesium oxide and the formation of solid solutions in the $MgO-Al_2O_3-Cr_2O_3$ system were studied by phase chemical, x-ray diffraction, and microscopic analyses. Three compositions $Mg(Al_{1-x}Cr_x)_2O_4$, where $x = 0.2, 0.5$, and 0.8 , obtained from pressed and sintered oxide powder mixtures, were investigated. The following sequence of formation of solid solutions is proposed: the two spinels $MgAl_2O_4$ and $MgCr_2O_4$ are formed first, then solid solutions arise at the site of their contact. No solid solutions of Cr_2O_3 and Al_2O_3 were observed. The formation of solid solutions ends at $1400^\circ C$. Thus, chromic oxide is apparently a good mineralizer in the low-temperature synthesis of $MgAl_2O_4$. The phase transformations studied appreciably affect the technical properties of the products. Thus, solid solutions of the high-alumina region of the $MgO-Al_2O_3-Cr_2O_3$ system have a high mechanical strength and sinter well. This should be considered in selecting processes

SOURCE: Ogneupory, no. 1, 1967, 55-60

TOPIC TAGS: refractory metal, compressive strength, porosity,
metal deformation, magnesium oxide, chromium oxide, zirconium
oxide, metal bonding

ABSTRACT:

It is well known that because of some specific properties, high-melting Mg, Cr, and Zr oxides cannot be used individually for the preparation of refractories. Refractories with desirable properties may be obtained from mixtures of preliminarily heat-treated MgO , Cr_2O_3 , and ZrO_2 . The main purpose of this article is to study the technical properties of compositions containing MgO in amounts enough to bond completely Cr_2O_3 into $MgCr_2O_4$ and to stabilize ZrO_2 . The ultimate compression strength, apparent density, apparent porosity, temperature of deformation under stress, linear setting, and chemical stability with respect to CaO and Fe_2O_3 were determined for...

seven specimens of $\text{MgO}-\text{Cr}_2\text{O}_3-\text{ZrO}_2$ refractories of different composition. The specimens were obtained by sintering mixtures of dry (at 120C) uncalcined ZrO_2 , calcined (at 1300 and 1600C) MgO , and MgCr_2O_3 . The latter was obtained by sintering mixtures of pure MgO and Cr_2O_3 at 1400 and 1750C. Composition of the refractories before and after firing are given in Table 1. Properties of the compositions are shown in Tables 2 and 3.

Table 1. Composition of specimens studied, %

No		Initial composition			Final phase composition

TITLE: The production of ²⁷vanadium, ²⁷niobium, and ²⁷tantalum foil 16

SOURCE: Ukrayins'kyy fizychnyy zhurnal, v. 11, no. 8, 1968, 924-925

TOPIC TAGS: metal foil, foil production, vanadium, niobium, tantalum, *nuclear research*

ABSTRACT: The aim of this work was to produce free foil of vanadium, niobium, and tantalum for nuclear and possibly other studies. A variation of the Van-Arkel method of thermal decomposition of iodides of these metals was used to produce foil of great chemical purity and uniform thickness in two stages: (1) deriving pure iodides of Va, Nb, and Ta and (2) thermal decomposition thereof to form the foil. Vanadium diiodide, niobium pentalodide, and tantalum pentalodide were placed in a device consisting of a vacuum chamber, crucible, crucible cover, and resistance furnace. The heated iodides were decomposed and the pure metals were deposited on the cover, the material of which has to fulfill the following conditions: (1) have a melting temperature higher than that of the iodide in question, (2) be subject only to weak iodide

2

diffusion at iodide decomposition temperatures, and (3) not be attacked by the same solvents as the deposited foil. A beryllium cover was used for Va; and a molybdenum cover for Nb and Ta: Foil thickness, varying from 1.2 to 12 m, was produced locally by an absorption method involving a narrow monochromatic x-ray beam. Orig. art. has: 1 table and 2 figures.

TITLE: Impregnation of graphite with new synthetic resins

CITED SOURCE: Tr. Vses. n.-i. i konstrukt. in-t khim. mashinostri, vytp. 42, 1962, 67-75

TOPIC TAGS: graphite, graphite impregnation, resin, synthetic resin, polymer

ABSTRACT: Dry graphite parts were placed in an autoclave, and heated to 600 in a vacuum of 730-750 mm/Hg, which was continued for 2 hrs. without heating, after which resin was drawn into the autoclave, air was introduced under a pressure of 5-6 atm. and the pressure was maintained for 3-3.5 hrs. After that, the objects were removed, freed of the resin and again heated at 500 for 1 hr., followed by heating to 1400, increasing the heat at the rate of 10°/hr. The emulsifying resin tested was composed of liquid bakelite and vinylchloride lacquer, and furfural acetone. The treatment was repeated twice. After the treatment the objects increased in weight by 17-21%, and became impermeable to water under a water pressure

TITLE: Improved Open-hearth Furnace Ends (Usovershenstvovannyye golovki martenovskikh pechey)

PERIODICAL: Metallurg, 1957, No.8, pp. 26 - 27 (USSR).

ABSTRACT: The authors describe a design of open-hearth furnace and adopted at the Khimnii Tagil' Metallurgical Combine in 1954 for 140-ton furnaces fired with mixed (coke-oven and blast furnace) gas. There are three air ports, two of them arched, inclined at 11° to the bath surface and situated on either side of and on the same level as the gas port, and the third above the gas port. Two 1 1/4-inch diameter tubes were provided on either side of the port for compressed-air injection, and the authors discuss briefly compressed-air injection practice at the Kuznetsk Metallurgical Combine (KMK) (through a slot under the gas port). The Kuznetsk method was less effective than that of injecting the compressed air at the sides of the port, and the latter practice was extended to Venturi furnaces (leading to a 9.5% increase in production per unit working time, compared with one of 11.5% for arch ends). The authors present comparative data on the operation of 140-ton furnaces with various types of head with compressed air injection and also Card 1/2 for a Venturi-end furnace without the injection. The data

TITLE: Testing of Dinas Bricks Containing Magnesium and Manganese in the Vaults of Martin Furnaces (Ispytaniye tinsov magnesiya i manganitsy v svodakh martenovskikh pechey)

PERIODICAL: Ogneupory, 1958, ²⁷ Nr 10, pp. 476-479 (USSR)

ABSTRACT: Dinas VFD of high density and with a high silicic acid content was used in the vaults of the Martin furnaces of the Nizhne-Tagil'skiy metallurgicheskiy kombinat (Nizhny Tagil Metallurgical Combine). Its stability proved to be higher than that of normal Dinas, as is seen from the work of G.V. Gurskiy, I.S. Kaynarokiy, A.P. Klyucherov, B.Ye. Pindrik. A process for the technical production of this material has been developed by the Ukrainskiy nauchno-issledovatel'skiy institut ogneuporov (Ukrainian Scientific Research Institute for Refractory Products). Because of the low press capacity of the Pervoural'skiy dinazovyy zavod (Pervoural'sk Dinas Works) it has not been possible to increase production sufficiently. Ural'skoye otdeleniye Leningradskogo instituta ogneuporov (Ural Branch of the Leningrad Institute for

Card 1/2

Testing of Dinas Bricks Containing Magnesium
and Manganese in the Vaults of Martin Furnaces

SOV/131-58-10-7/11

Refractory Products) recommended that the properties of the Dinas be improved by adding about 0,6 % MnO and 0,2 % MgO. The table shows the chemical composition and the physico-mechanical properties of Dinas **MDU** with high magnesium and manganese content in comparison with Dinas **VFD** and normal Dinas. The tests carried out proved that Dinas **MDU** and **VFD** are equally thermostable, but that the agglomeration of the former is inferior to that of the latter. There are 1 table and 1 reference which is Soviet.

TITLE:

Test of Periclase-forsterite Bricks in Regenerators of Martin Furnaces

PERIODICAL:

Ogneupory, 1960, Nr 2, pp 85-87 (USSR)

ABSTRACT:

This investigation was carried out in 1958 at the Nizhne-Tagil'skiy metallurgicheskiy kombinat (Nizhniy Tagil Metallurgical Kombinat) and is described by the authors. The Martin furnaces were heated by blast-furnace gas under the addition of oxygen. The following persons participated in the investigations: I. I. Lesunov (deceased), S. N. Galakhmatov, L. P. Pologova, Ye. K. Koshevnikova, P. N. D'yachkov, and I. N. Stepanova. The bricks were produced at the "Magnesit" Works from magnesites of the Onotskoye deposit in accordance with the procedure by the Vostochnyy nauchno-issledovatel'skiy i proyektnyy institut ogneuporov (Eastern Scientific Research and Design Institute for Refractories). The quality of the periclase-forsterite bricks is mentioned in table 1. The temperature fluctuations of the upper part of the regenerator masonry are given in table 2. The properties of the refrac-

Tolokonnikov, Leonid Stepanovich, Mikhail Mikhaylovich Sokolov, Abram Solomonovich Sandler, Vladimir Ivanovich Klyuchev, Yevgeniye Petrovich Ivanov, and Yevgeniy Nikolayevich Zimin

Atlas elektromekhanicheskikh promyshlennykh ustanovok, ch. 1. Elektroprivod i peredatochnyye mekhanizmy (Atlas of Electromechanical Industrial Installations, Pt. 1. Electric Drive and Transmission Mechanisms) Moscow, Gosenergoizdat, 1958. 140 p. 6,500 copies printed.

Chief Ed.: M.G. Chilikin; Eds. (Title page): A.T. Golovan and Leonid Stepanovich Tolokonnikov; Ed. (Inside book): A.L. Saparova; Tech. Ed.: N.I. Borunov.

PURPOSE: The atlas is intended as a manual for students working on machine parts projects and on term and diploma projects related to electrical equipment for drives.

COVERAGE: The atlas presents electromechanical installations for driving, hoisting, and transporting mechanisms (cranes, excavators, hoists, conveyers), rolling mills (continuous rolling mills), metal forming equipment, metal-cutting machine tools and automatic transfer lines. Drawings of general views of mechanisms and drives with the distribution of electrical equipment, elementary circuits and

wiring diagrams with the necessary explanations are presented. The mechanical and electrical parts of every mechanism or device are closely related in the manual to enable joint treatment of the subject and to improve the level of preparation for design. In compiling the atlas most recent design material of the following institutions was used: scientific research institutes VNIITMASH; TsKB "Elektroprivod," TsNIITMASH, NIIPromash, PKO "Soyuzprommekhanizatsiya," GPI, Tyazhpromelektroproyekt, Institutes MEI and MISI; and Plants "Dinamo" and "Pod'yemnik." No personalities are mentioned. There are 28 references, all Soviet.

The conference was organized on the initiative of
the Institute of Automation and Telemechanics of the Academy
of Sciences, USSR, and the Moscow Power Engineering Institute.
The main aim of the conference was to bring together leading
experts of automatic control of electric drives. The
first conference was on the subject of automatic electric drive
took place over the 10 years before the present one and
was concerned with electric drives. The results of this
conference were found to be valuable in the task of re-
building postwar Soviet industry and in furthering industrial
development. Present technical developments of Soviet industry
demand high speeds, simplicity of construction, reliability
of operation, and economy. The electrical-thermal energy
with frequency control appears to be the most promising means
of controlled A-C drive. For wide application of this drive
in the Soviet economy there is a need of developing new types
of frequency converters. Some interesting studies were made
in this connection at the Institute of Automation and Telemechanics
of the USSR Academy of Sciences and its Leningrad
branch, at the Moscow Power Engineering Institute, the Central
Design Bureau of the Ministry of Defense, the State Design
Bureau of the Ministry of Construction of the USSR, and
in other design organizations. These studies were discussed
at the present conference. The transactions contain material
concerning the theory and design of reactor, pole, and
frequency methods of controlling electric drives.
Candidates of Technical Sciences I.P. Shain and Engineer V.A.
Kiselev participated in the preparation of this collection
of papers. The volume was reviewed by Professor Dr. V. F. Rikover,
Director of Technical Sciences. Some of the papers include a
bibliography.

TITLE: Use of Magnetic Amplifiers for the Control of the Generator-Motor System in Electric Excavator Drives (Primeneniye magnitnykh usiliteley dlya upravleniya sistemoy generator -dvigatel' v elektroprivodakh ekskavatorov)

PERIODICAL: Elektrichestvo, 1958, Nr 6, pp. 59-63 (USSR)

ABSTRACT: In order to investigate the problem of the technical possibilities of an arrangement with a magnetic amplifier as generator exciter the technological requirements of the electric drive of an excavator are analysed. The safeguard of the required time in the transient processes of starting, turning, and braking is most important for their favorable progress as well as the limiting of the electric-motor current during the transient processes. Because of the considerable electromagnetic inertia of the generator the guarantee of the required time by the transient processes is connected with the necessity of forcing their excitation. In the arrangement with one electrodynamic amplifier (EDA) and one magnetic intermediate amplifier (MIA) the generator excitation processes are

forced by means of a rigid negative return coupling to the generator voltage and a limitation of current by the use of a negative connection to the armature current by cutting-off. This diagram excludes favorable characteristic properties for the electric drive of the turning. The character of the transient processes is not changed essentially by the substitution of the EDA-MIA cascade by a magnetic amplifier without changing the diagram and the return-coupling character. A diagram is shown here which renders the use of the magnetic amplifier for a direct control of the generator field in the excavator drives more expedient. The characteristic excavator properties of the electric drive are produced in this case by using the nonlinearity of the characteristic curve of the magnetic amplifier, the continuous current return coupling, and the positive voltage return coupling. In order to increase the reliability of the motor-current limitation the negative current connection is made by introducing the control winding circuit of the armature-current circuit into the current circuit. In this case the voltage drop of the control winding circuit is proportional to the armature current, and thus the number of control circuits and of control contacts is decreased, too. -From Sept-

ember to October 1957 industrial tests of the electric drives were made in the Kounrad Mine at the excavator EKO-8 (E-6) according to the diagram with EDA and MIA and to that with a magnetic amplifier. The analysis of the oscillograms proves the correctness of the results in the comparison of the investigated diagrams and shows that the system with a magnetic power amplifier guarantees higher qualitative and quantitative indices. The tests were made with all the three basic electric drives of the excavator (turning, raising, pressing) and showed analogous results. The theoretical analysis and the test results of the arrangement generator-motor with a magnetic amplifier prove the great technical possibilities of this diagram. The simplicity of this diagram and the absence of any oscillation tendency essentially simplify the adjustment. There are 5 figures and 1 Soviet reference

1. The first of these is the fact that the majority of the population of the United States is now living in urban areas. This is a result of the process of urbanization, which has been going on since the beginning of the 20th century. The population of the United States has increased from about 100 million in 1900 to over 200 million in 1960. At the same time, the population of rural areas has decreased from about 100 million in 1900 to about 50 million in 1960. This has led to a concentration of the population in urban areas, which has had a number of important consequences for the development of the United States.
